This human MGF has a mature extracellular region of 185 amino acids. There is a second form of hMGF (see AAQ20844) resulting from an additional use mind splicing event which deletes an exon encoding an additional 28 amino acids beginning at amino acid 148 of the mature protein. MGF is the ligand for the protein receptor expression product of the c-kit proto-oncogene. MGF can be used to augment the activity of other cytokines. It can influence early lymphoid or myeloid development. See also AAQ20842-3 and AAQ22204-7. (Updated on 25-MAR-2003 to correct PA field.)

This sequence represents a membrane bound form of a human recombinant stem cell factor (SCF). Stem cell factors are also known as mast cell growth factors (MCF). Stem cell factors (SF or SLF) are haematopoietic type SCF sequence (MCF) or Steel factors (SF or SLF) are haematopoietic factors which act on haematopoietic progenitor cells. Analogues of a wild type SCF sequence have been constructed (see AAW27605 and AAW27606) which have increased blological activity and stability compared to unmodified SCF and can be used treat pigmentation disorders, e.g. vitilago, acquired immunodeficiency syndrome, nerve damage, infertility, intestinal damage canaemia, enhance bone marrow engraftement during transplantation or bone marrow recovery following radiation, chemical or chemotherapeutic, induced bone marrow aplasia or myelosuppression, sensitise cells to chemotherapy or mobilise peripheral blood progenitor cell, preferably bone marrow or peripheral blood progenitor cell, preferably bone marrow or peripheral blood progenitor cell, uniture medium, where the cells are optionally subsequently transfected with exogenous DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MDVLPSHCWISEMVVQLSDSLTDLLDKFSNISEGLSNYSIIDKLVNIVDDLVECVKENSS 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Stem cell factor analogue N10D or N10D/N11D - useful to treat pigmentation disorder, AIDS, nerve damage, infertility, intestinal damage or haematopoietic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             KPFMLPPVAASSLRNDSSSSNRKAKNPPGDSSLHWAAMALPALFSLIIGFAFGALYWKKR 240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAR83978 is a human stem cell factor (SCF) derived from the HT1080
fibrosarcoma cell line. Non-naturally occuring SCF and C-terminally
cruncated polypetides, having amino acid sequences sufficiently
duplicative of naturally occurring SCF, stimulate growth of printive
progenitors such as haematopoietic progenitor cells, neural stem cells
and primordial germ stem cells. The peptides can be used in a composition
for treating leucopenia, anaemia or thrombocytopenia, for enhancing
engraftment of bone marrow during transplantation or for bone marrow
convery after chemotherapy or radiation-induced bone marrow application or myelosuppression. They can also be used for treating neoplasia, nerve
damage, infertility, intestinal damage or myeloproliferative disorders.
Antibodies may be raised against the peptides for use in detection or
cutralisation of SCF in serum. SCF may be useful for the treatment of
AIDS and severe combined immunodeficiency (SCID) states alone or in
combination with other factors such as IL-7. (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            180

                                                                                                                                                                                                                                                                                                             g
                                                                                                                                                                                                                                                                                                                                                                                Administration to a subject. The method comprises: (a) obtaining haematopoietic progenitor cells from a donor; and (b) expanding the cells haematopoietically effective dose of a by adding to the cells a haematopoietically effective dose of a confirmation and one or more of the brimary structural properties of naturally confirmation and one or more of the biological properties of naturally cocurring stem cells factor (SCP). The method is useful for stimulating primitive progenitor cells including early haematopoietic progenitor cells including early haematopoietic progenitor cells which are capable of maturing to erythroid, megakaryocyte, granulocyte, lymphocyte and macrophage cells. SCP results in absolute increases in haematopoietic cells of both myeloid and lymphoid lineages. SCF is useful for treating haematopoietic progenitors in syngeneic, allogeneic for expanding early haematopoietic progenitors in syngeneic, allogeneic cells. SCP is useful for treating haematopoietic progenitors in syngeneic, allogeneic cells. SCP is useful for renaplant. SCF is useful for enhancing the cefficiency of gene therapy based on transfecting haematopoietic seconds. Cells. SCP is also useful for combacting the myelosuppressive effects of anti-HIV drugs such as AZT and for enhancing haematopoietic recovery cellering cancer acute blood loss and as a boost to the immune system for fighting compassa (claimed human SCF from the present invention
Production of hematopoietic cells suitable for administration to a subject using progenitor cells and expanding the cells using stem cell
                                                                                                                                                                                                                                      forming;

vitro, comprising exposing (II) that expresses a stem cell factor (SCF) receptor to a biologically active SCF, its analogue or fragment, which induces cell proliferation, and introducing (I) to (II) in vitro. Exposure of SCF to (II) results in increased uptake of (I) into the cell. The method is useful for enhancing the efficiency of the transfer of a useful in gene therapy techniques. Addition to Addition of the present equences used in the exemplification of the present
                                                                                                                                                                                                                                                                 MDVLPSHCWISEMVVQLSDSLTDLLDKFSNISEGLSNYSIIDKLVNIVDDLVECVKENSS 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                               The present invention describes a method for enhancing (B) the efficiency of transfer of a polynucleotide (I) into a target mammalian cell (II) in vitro, comprising exposing (II) that expresses a stem cell factor (SCP) receptor to a biologically active SCP, its analogue of fragment, which induces cell proliferation, and introducing (I) to (II) in vitro. Exposure of SCF to (II) results in increased uptake of (I) into the cell. The method is useful for enhancing the efficiency of the transfer of a polynucleotide into a atarget mammalian efficiency of the transfer of a useful in gene therapy techniques.                                          Enhancing efficiency of transfer of polynucleotide into a target mammalian cell in vitro, involves exposing cell that expresses a stem cell factor receptor to stem cell factor, and introducing polynucleotide into cell in vitro.
                                                                                                                                                                                                                                                                                                                                                                                                                             KOLKKSPKSPEPRLFTPEEFPRIFNRSIDAPKOFVVASETSOCVVSSTLSPEKOSRVSVT

The present invention provides the protein and coding sequences of mammalian stem cell factors (SCFs). These are capable of stimulating the growth of early haematopoietic progenitor cells, neural stem cells and primordial germ stem cells. The sequences are useful in the treatment of leukacemias, haematopoietic disorders, aplastic anaemia, paroxysmal naemoglobinuria, malaria, pigmentation disorders, neurological and intestinal damage, infertility, AIDS and severe combined immunodeficiency (SCID). The present sequence is an SCF described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 MKKTQTWILTCIYLQLLLFNPLVKTEGICRNRVTNNVKDVTKLVANLPKDYMITLKYVPG

These are capable of stimulating the growth of early haematopoietic progenitor cells, neural stem cells and primordial germ stem cells. The sequences are useful in the treatment of leukaemias, haematopoietic disorders, aplastic anaemia, paroxysmal naemaglobinuria, malaria, pigmentation disorders, neurological and intestinal damage, infertility, AIDS and severe combined immunodeficiency (SCID). The present sequence is an SCF described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated non-human mammalian stem cell factor polypeptide stimulating growth of early hematopoietic progenitor cells, useful for treating aplastic anemia, lymphoma, Letterer-Siwe disease, Kala azar, sarcoidosis.

These are capable of stimulating the growth of early haematopoietic progenitor cells, neural stem cells and primordial germ stem cells. The sequences are useful in the treatment of leukaemias, haematopoietic disorders, aplastic anaemia, paroxysmal nemoglobinuria, malaria, pigmentation disorders, neurological and intestinal damage, infertility, AIDS and severe combined immunodeficiency (SCID). The present sequence is an SCF described in the

The present sequence representing human SCF (stem cell factor) protein is isolated from the HT1080 fibrosarcoma cell line. The present invention cals isolated from the HT1080 fibrosarcoma cell line. The present invention cells to perform cell factors (AAB73561-AAB73557) and the polymucleotides encoding them. SCF stimulate primitive progenitor cells including early haematopoietic progenitor cells. The invention also central peptides (AAB7378-AAB73579) and the oligonucleotides (AAB73895) used in the isolation of human and rat SCF sequences. (AAB723895-AAB73895) used in the isolation of human and rat SCF sequences. The polymucleotide encoding SCF is useful for producing SCF and useful in CC gene therapy. It is useful for treating disorders involving blood cells cauch as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hoddkin's disease, lymphoma, Gaucher's disease, anaemia, congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis, disseminated fungus disease, Pulminating septicaemia, malaria, vitamin Blz and folic acid deficiency, pyridoxine deficiency, and hypopigmentation disorders such as piebaldism and vitiligo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    KOLKKSFKSPERPRLFTPEEFFRIFNRSIDAFKOFVVASETSDCVVSSTLSPEKOSRVSVT 180

The present sequence represents human stem cell factor (SCF). The cDNA encoding this sequence is isolated from the HT1080 fibrosarcoma cell line. The sequence is described in an invention relating to novel stem cell factors, the polynucleotides encoding them and methods for producing the stem cell factors. The methods involve increasing the number of early haematopoietic progenitor cells in human peripheral blood by administering a haematopoietically effective human stem cell factor including myelofibrosis, myelosclerosis, osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, ilymphoma, qaucher's disease, Niemann-Pick disease, refractory anaemia, milataia, vitamin B12 and folic acid deficiency, hypopigmentation disorders i.e. piebaldism and viral induced disorders, including AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MDVLPSHCWISEMVVQLSDSLTDLLDKFSNISEGLSNYSIIDKLVNIVDDLVECVKENSS 120

                                                                                                                                                                                                                                                                                                                                                                                                The present sequence representing human SCF (stem cell factor) protein is isolated from the HT1080 fibrosarcoma cell line. The present invention relates to novel stem cell factors (AAU02776, AAU02770-AAU02775, AAU02797) and the polymuclectides encoding them. SCF stimulate primitive progenitor cells including early haematopoietic progenitor cells. The invention also describes SCF peptides (AAU02777-AAU02794) and the olymuclectides (AAU02777-AAU02794) and the cincention also describes SCF peptides (AAU02777-AAU02794) and the cat SCF sequences. The polymuclectide encoding SCF is useful for producing SCF and useful in gene therapy. It is useful for treating producing SCF and useful in gene therapy. It is useful for carcinoma, acute leukaemia, multiple myelofibrosis, metastatic carcinoma, acute leukaemia, multiple myelofibrosis, metastatic carcinoma, acute leukaemia, multiple myelofibrosis, military tuberculosis, disseminated fungus disease, lancomegaly, military tuberculosis, disseminated fungus disease, bulminating septicemia, malaria, vitamin B12 and folic acid deficiency, pyridoxine deficiency, and hypopigmentation disorders such as piebaldism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               121 KDLKKSFKSPEPRLFTPEEFFRIFNRSIDAFKDFVVASETSDCVVSSTLSPEKDSRVSYT 180

The present invention relates to novel non-naturally-occurring stem cell factor (SCF) polypeptides having an amino acid sequence sufficiently duplicative of that of naturally-occurring SCF to allow possession of haematopoietic biological activity of naturally occurring SCF. Sequences of the invention are useful for treating leucopaenia, thrombocytopaenia,

```
consemia and for enhancing bone marrow recovery in treatment of radiation, engraftment of bone marrow during transplantation in mammals and chemical or chemorkerapeutic induced bone marrow aplasia or myclosuppression. They care also useful for treating acquired immune deficiency in a human, nerve damage, neoplasia, infertility, myeloproliferative disorder, intestinal camage, neoplasia, infertility, myeloproliferative disorder, intestinal camamal. STG sequences are useful for preparing blologically active polymer polypeptide adduct, for enhancing transfection of early cative polymer polypeptide adduct, for enhancing transfection of early cative polymer polypeptide adduct, for enhancing transfection of early categopetrosis, metastatic carcinoma, acute leukaemia, myeloslarosis, osteopetrosis, metastatic carcinoma, acute leukaemia, myeloma, costeopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hoddkin's disease, lymphoma, Gaucher's disease, Niemann-Pick disease, Letterer-Siwe disease, refractory erythroblastic anaemia, pi Guglielmo sylandrome, congestive splenomegaly, Kala azar, asarcoidosis, primary splenomegaly, mand azar, asarcoidosis, primary caplenic pancycopaemia, diseaminated fungue disease, malaria, military tuberculosis, Pulminating septicaemia, pyridoxine deficiency, vitamin B12 and folic acid deficiency, plamond Blackfan anaemia, hypopigmentation disorders such as piebaldism, AIDS (acquired immune deficiency syndrome) conductiligo. The present sequence is human SCF protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RI "Expression of two types of kit ligand mRNAs in human tumor cells.";

RI Int. J. Hematol. 55:301-304(1992).

- I- FUNCTION: Stimulates the proliferation of mast cells. Able to augment the proliferation of both myeloid and lymphoid augment the proliferation of both myeloid and lymphoid coll-cell adhesion. Acts synergistically with other cytokines, or probably interleukins.

CC probably interleukins.

CC probably interleukins.

- SUBINIT: Homodimer, non-covalently linked (Probable).

- SUBINIT: Homodimer, non-covalently linked (Probable).

- SUBINIT: Homodimer, non-covalently linked (Probable).

- ALTERNATIVE PRODUCTS:

Evente-Alternative splicing; Named isoforms 1 only) (By similarity).

- ALTERNATIVE PRODUCTS:

Evente-Alternative splicing; Named isoforms=2;

Name=1; Synonyms=SCF220;

- ISOId=P21583-1; Sequence=Displayed;

- ISOId=P21583-2; Sequence=Usp 006022;

- IDEVELOPMENTAL STAGE: Acts in the early stages of hematopoiesis.

- I- PTM: A soluble form is produced by proteolytic processing of isoform 1 in the extracellular domain.

- ISOId=P2188: NAME=Atlas Genet. Cytogenet. Oncol. Haematol.;

- HOMIARIY: Belongs to the SCF family.

- HOMIARIY: Belongs to the SCF family.

- HOMIARIY: Belongs to the SCF family.

A Murray J.D., Bowling A.T.;
The proliferation of mast cells. Able to
submitted (JAN-2000) to the EMBL/GenBark/DDBJ databases.

- I- FUNCTION: Stimulates the proliferation of mast cells. Able to
augment the proliferation of both myeloid and lymphoid
hematopoietic progenitors in bone marrow culture. Mediates also
cell-cell adhesion. Acts synergistically with other cytokines,
probably interleukins (By similarity).

- SUBGELLULAR LOCATION: Type I membrane protein. Also exists as a
secreted soluble form (By similarity).

- PTMR A soluble form is produced by proteolytic processing of the
extracellular domain (By similarity).

- SIMILARITY: Belongs to the SCF family.

                                                                                               DNA Seq. 6:233-237(1996).

DNA Seq. 6:233-217(1996).

-!- FUNCTION: Stimulates the proliferation of mast cells. Able to augment the proliferation of both myeloid and lymphoid hematopoidetic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synergistically with other cytokines, probably interleukins (By similarity).
-!- SUBUNIT: Homodimer, non-covalently linked (Probable).
-!- SUBCELLULAR LOCATION: Type I membrane protein (isoforms I and 2) Also exists as a secreted soluble form (isoform I only) (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ë

C. -- FUNCTION: Stimulates the proliferation of mast cells. Able to augment the proliferation of both myeloid and lymphoid hematopoietic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synergistically with other cytokines, probably interleukins (By similarity).

C. -- SUBGNIT: Homodimer, non-covalently linked (Probable).

Secreted soluble form (By similarity).

C. -- PTM: A soluble form (By similarity).

C. -- PTM: A soluble form (By similarity).

C. -- PTM: A soluble form (By similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                Isola-Q28132-2; Sequence=VSP 006020; PTM: A soluble form is produced by proteolytic processing of isoform 1 in the extracellular domain (By similarity). POLYMORPHISM: The roan locus is responsible for the coat coloration of Belgian Blue and Shorthorn cattle. The solid-colored and white animals are homozygotes, and the roan animals, with intermingled colored and white hairs, are heterozygous. The roan Shonthorype is due to the Asp-218 mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 MKKTQTWIITCIYLQLLFPPLVHTQGICSNRVTDDVKDVKLVANLPKDYMITLKYVPG

Mamm. Genome 10:710-712(1999).

-I- FUNCTION: Stimulates the proliferation of mast cells. Able to augment the proliferation of both myeloid and lymphoid hematopoietic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synergistically with other cytokines, probably interleukins (By similarity).

-I- SUBGNIT: Homodimer, non-covalently linked (Probable).

-I- SUBCELLUAR LOCATION: Type I membrane protein (isoforms 1 and 2).

Also exists as a secreted soluble form (isoform 1 only) (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MKKTQTWILTCIYLQLLLFNPLVKTEGICRNRVTNNVKDVTKLVANLPKDYMITLKYVPG

Thm: A soluble form is produced by proteolytic processing
isoform in the extracellular domain (By similarity).
SIMILARITY: Belongs to the SCF family.
                                                                                                        4182BE9AED00793B CRC64;

                                                                                                                                                                                                                                                                                                                                    Cell 63:195-201(1990).

-1- FUNCTION: Stimulates the proliferation of mast cells. Able to augment the proliferation of both myeloid and lymphoids augment the proliferation of both myeloid and lymphoids also hematopoietic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synergistically with other cytokines, probably interleukins.
-1- SUBURIT. Homodimer, non-covalently linked (Probable).
-1- SUBCELLUIAR LOCATION: Type I membrane protein (isoforms 1 and 2) Also exists as a secreted soluble form (isoform 1 only) (By similarity).
                                                                                                                     PROTEIN SEQUENCE OF 26-39.

Cell 63:167-174(1990).

-I- FUNCTION: Stimulates the proliferation of mast cells. Able to augment the proliferation of both myeloid and lymphoid hematopoletic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synergistically with other cytokines, probably interleukins.
-I- SUBJUNT: Homodimer, non-covalently linked (Probable).
-I- SUBCELLULAR LOCATION: Type I membrane protein (isoforms 1 and 2).
Also exists as a secreted soluble form (isoform 1 only) (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PARTIAL PROTEIN SEQUENCE OF 26-78.

Able to augment the proliferation of both myeloid and lymphoid hematopoietic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synergistically with other cytokines, probably interleukins (By similarity).
SUBUNIT: Homodimer, non-covalently linked (Probable).
SUBCELLULAR LOCATION: Type I membrane protein. Also exists as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              P79368; Q28591;

secreted soluble form (By similarity).

PTM: A soluble form is produced by proteolytic processing of extracellular domain (By similarity).

SIMILARITY: Belongs to the SCF family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ï
